C; Species: Rattus sordidus villosissimus (southeastern Australian rat)
C; Date: 03-Feb-1994 #sequence_revision 03-Feb-1994 #text_change 05-Nov-1999
C; Accession: A47630
R; Gutman, G.A.; Besta, R.M.; Frank, M.B.; Baverstock, P.R.
Immunogenetics 26, 14-20, 1987
A; Title: Duplication of J-kappa genes within genus Rattus.
A; Reference runmber: A47630; MUID:87278355; PMID:3111993
A; Accession: A47630
A; Accession: A47630
A; Status: preliminary; not compared with conceptual translation
A; Molecule type: DNA
A; Residues: 1-13 < GUT>
A; Residues: 1-13 < GUT>
C; Keywords: heterotetramer; immunoglobulin

New peptides corresponding to Streptococcus pneumoniae PsaA, used for treating or preventing Streptococcus pneumoniae infection in a

WPI; 1999-540849/45.

```
AAY30351-54 represent immunogenic peptides which are derived fro a pneumoccocal surface adhesion A protein (PsaA). The specificat describes monoclonal antibodies which bind epitopes of the PsaA (e.g present sequence). The peptides can be used in vaccines to Streptococcus pneumoniae infections. The antibodies of the invencan also be used to detect S. pneumoniae in a sample or individu

Carlone Sampson JS, Jue DL, Johnson SE, Ades EW,

2002-195762/25 WPI;

A or cal antigenic peptide for immunizing against streptococ vinds to monoclonal antibody obtained in response to vanimal with pneumococcal surface adhesion protein infections, binds to immunizing an animal multiple fragment

56; 86pp; English. 2; Page Claim

The invention relates to multiple antigenic peptides (MAP) immunogenic against Streptococcus pneumoniae. MAP binds to monoclonal antibody obtained in response to immunising an animal with pneumococcal surface adhesion protein A (PsaA) or its fragment. MAP is useful for conferring protective immunity against S. pneumoniae infection in a subject. The present sequence is Streptococcus pneumoniae PsaA immunogenic peptide.

or Novel synthetic fibrin-binding moiety, useful for detecting, imaging localizing fibrin-containing clots by magnetic resonance imaging, radioimaging and for treating diseases involving thrombus formation e.g. stroke -

55; 89pp; English. Page Claim 4;

The invention relates to a synthetic fibrin binding group having affinity for fibrin. The involves (a) detectably labelling the binding group, (b) administering to the subject the labelled polypeptide, and (c) detecting the labelled polypeptide, and (c) detecting the labelled polypeptide in the subject. The invention is useful for the treating a disease involving thrombous about thrombous thrombous the labelled polypeptide in the subject. The invention is useful for the labelled polypeptide in the subject. The binding moieties are useful infarct, reperfusion ischaemia or stroke. The binding moieties are useful infarct, reperfusion ischaemia or stroke. The binding moieties are useful infarct, reperfusion ischaemia or stroke. The binding moieties are useful or the diagnosis and treatment of coronary conditions where fibrin plays a role. The fibrin binding moieties are useful for detecting and diagnosing numerous pathophysiologies in which fibrin plays a role eg. peritoneal adhesions which often occur after surgery or inflammatory and neoplastic processes and are comprised of a fibrin centuritis, lupus or septic arthritis which often have bits of fibrin containing tissues called rice bodies in the synovial fluid of their arthritis, lupus or septic arthritis which often have bits of fibrin arterioles causes turbulent blood flow resulting in stress and destruction of red blood cells. The fibrin specific agents can also be containing tissues turbulent blood flow resulting in stress and destruction of red blood cells. The fibrin specific agents can also be retinopathy, early or high-risk atherosclerosis and other autoimmune and inflammatory disorders. Fibrin specific agents also could provide both direct or surrogate markers of disease models in which hypoxia and anglosensis are expected to play a role. The invention is also useful for screening molecular libraries. The present sequence is a fibrin binding loop

The invention relates to a synthetic fibrin binding group having affinity for fibrin. The invention is useful for detecting fibrin in a mammalian subject which involves (a) detectably labelling the binding group; (b) administering to the subject the labelled polypeptide, and (c) detecting the labelled polypeptide, and (c) detecting the labelled polypeptide, and (c) detecting the labelled polypeptide in the subject. The invention is useful for treating a disease involving thrombus formation eg. deep-vein thrombosis, pulmonary embolism, cardiogenic thrombosis, atherosclerosis, myocardial infarct, reperfusion ischaemia or stroke. The binding moieties are useful for detection, imaging and localisation of fibrin-containing clots by magnetic resonance imaging, radioimaging and other imaging methods and are also useful in the diagnosis and treatment of coronary conditions where fibrin plays a role. The fibrin binding moieties are useful for detecting and diagnosing numerous pathophysiologies in which fibrin plays a role eg. peritoneal adhesions which often occur after surgery or inflammatory and neoplastic processes and are comprised of a fibrin network, fibroblasts, macrophages and new blood vessels; rheumatoid arthritis, lupus or septic arthritis which often have bits of fibrin containing tissues called rice bodies in the synovial fluid of their joints; thrombootycopenic purpura, a type of anaemia in which deposits in other organs, as well as the detection of tumours, as well as the detection of tumours, and other autoimmne and teningmatory disorders. Pibrin specific agents also could provide both direct or surrogate markers of disease models in which hypoxia and

                                                                                                                                                                                                                                                                                                                              Peptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and D or the activation of transcription by E2F-1/DP-1 heterodimers. T may also be used for inducing apoptosis and/or cell cycle arrest a cell, particularly for treatment of cancer or other proliferat disorders such as psoriasis and restenosis.

                                                                                                                                                                                    factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP-1, or the activation of transcription by E2F-1/DP-1 heterodimers. They may also be used for inducing apoptosis and/or cell cycle arrest in a cell, particularly for treatment of cancer or other proliferative disorders such as psoriasis and restenosis.

                                                  The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the CSa-receptor (CSaR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CHIPS; Chemotaxis Inhibitory Protein; C5a-receptor; C5aR; formylated peptide receptor; FPR; neutrophil; monocyte; endothel inflammation; cardiovascular disease; central nervous system diseastrointestinal disease; skin disease; genitourinary disease; joint disease; respiratory disease; HIV infection; antiinflammaticardiant; cerebroprotective; neuroprotective; nootropic; dermato gynecological; immunosuppressive; anti-HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         derived from chemotaxis inhibiting prote THIPS) having CHIPS activity, useful in it of inflammation, cardiovascular, skin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the CSa-receptor (CSaR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gastrointestinal diseases, skin diseases, genitourinary disease diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.
                                         CHIPS; Chemotaxis Inhibitory Protein; C5a-receptor; C5aR; formylated peptide receptor; FPR; neutrophil; monocyte; endothel inflammation; cardiovascular disease; central nervous system disgastrointestinal disease; skin disease; genitourinary disease; joint disease; respiratory disease; HIV infection; antiinflammaticardiant; cerebroprotective; neuroprotective; nootropic; dermato gynecological; immunosuppressive; anti-HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CHIPS; Chemotaxis Inhibitory Protein; C5a-receptor; C5aR; formylated peptide receptor; FPR; neutrophil; monocyte; endothel inflammation; cardiovascular disease; central nervous system diseastrointestinal disease; skin disease; genitourinary disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, jo diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Combination of peptides derived from chemotaxis inhibiting protein Staphylococcus aureus (CHIPS) having CHIPS activity, useful in prophylaxis and treatment of inflammation, cardiovascular, skin and
   antiinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 6;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Indels

                                                                                                                                                                                                                                                                                             ¤
                                                                                                                                                                                                                                                                          The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders including cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.

                                           The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in sprophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.

or ging ion Novel synthetic fibrin-binding moiety, useful for detecting, imalocalizing fibrin-containing clots by magnetic resonance imaging radioimaging and for treating diseases involving thrombus format e.g. stroke

Claim 4; Page 55; 89pp; English.

The invention relates to a synthetic fibrin binding group having affinity for fibrin. The invention is useful for detecting fibrin in a mammalian subject which involves (a) detectably labelling the binding group; (b) administering to the subject the labelled polypeptide, and (c) detecting the labelled polypeptide in the subject. The invention is useful for treating a disease involving thrombus formation eg. deep-vein thrombosis, pulmonary embolism, cardiogenic thrombosis, atherosclerosis, myocardial infarct, reperfusion ischaemia or stroke. The binding moieties are useful

```
magnetic resonance imaging, radioimaging and other imaging methods and
magnetic resonance imaging, radioimaging and other imaging methods and
are also useful in the diagnosis and treatment of coronary conditions
where fibrin plays a role. The fibrin binding moieties are useful for
detecting and diagnosing numerous pathophysiologies in which fibrin plays

a role eg. peritoneal adhesions which often occur after surgery or
inflammatory and neoplastic processes and are comprised of a fibrin
network, fibroblasts, macrophages and new blood vessels; rheumatoid
arthritis, lupus or septic arthritis which often have bits of fibrin
containing tissues called rice bodies in the synovial fluid of their
joints; thrombocytopenic purpura, a type of anaemia in which deposits in
arterioles causes turbulent blood flow resulting in stress and
arterioles causes turbulent blood flow resulting in stress and
destruction of red blood cells. The fibrin specific agents can also be
cor other organs, as well as the detection of tumours, diabetic
retinopathy, early or high-risk atherosclerosis and other autoimmune and
inflammatory disorders. Fibrin specific agents also could provide both
direct or surrogate markers of disease models in which hypoxia and
angiogenesis are expected to play a roll or invention is also useful
angiogenesis are expected to play a roll or invention is also useful

                The present invention describes a method tor present... Lains novel oligome activity of new receptor modulating compounds (I) using novel oligome peptides (blokeys) which have differential abilities to bind to 2 different receptor conformations. The method is used to identify new drugs that are physiological or pharmacological agonists/antagonists that target various receptors, which are involved in certain disease conditions. The system may be used as a primary screening tool to identify hits, to classify lead compounds from a drug screen to, characterise selective oestrogen receptor modulators (SERMs) in terms agonist and antagonist function and to predict possible clinical effe of SERMs such as tissue and receptor specificity. The method can also applied to the fractionation of mixtures of SERMs to determine which applied to the fractionation of mixtures of SERMs to determine which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           including
                                                                                                                                                                                                                                                                                                                  components are producing agonistic and antagonistic activity. The may be used with other receptors (e.g. progesterone, androgen, glucocorticoid, thyroid, vitamin D, beta-adrenergic, dopamine and epidermal growth factor, to identify, characterise and classify modulators of receptor activity. Peptides comprising a LXXLL motif be used to modulate the oestrogen receptor in treating e.g. breast ovarian cancer and ameliorating the effects of menopause, including osteoporosis. AAY65439 to AAY65652 represent oestrogen receptor, estradiol receptor and oestrogen response element binding peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  represent oestrogen receptor, sponse element binding peptid

ng protein 9.13 polypeptide for various tumours and p tumours protein kinase malformation, embryonic development metabolic disorder serine/threonine

Chinese (disclosure); 35pp; 21 5; Page Example

9.13 The present invention discloses a serine/threonine protein kinase

```
the polynucleotides encoding the polypeptide, and a DNA recombination process to produce the polypeptide. The present invention also discloses applying the polypeptide in treating various diseases, such as embryonic development malformation, various tumours and protein metabolic disorder. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. The current sequence represents the serine/threonine protein kinase 9.13 N-terminal peptide sequence.

or imaging Novel synthetic fibrin-binding moiety, useful for detecting, imaging localizing fibrin-containing clots by magnetic resonance imaging, radioimaging and for treating diseases involving thrombus formation stroke e 9

58; 89pp; English. Claim 10; Page The invention relates to a synthetic fibrin binding group having affinity for for fibrin. The invention is useful for detecting fibrin in a mammalian subject which involves (a) detectably labelling the binding group; (b) administering to the subject the labelled polypeptide, and (c) detecting the labelled polypeptide in the subject. The invention is useful for treating a disease involving thrombosis, atherosclerosis, myocardial infarct, reperfusion ischaemia or stroke. The binding moieties are useful con detection, imaging and localisation of fibrin-containing clots by magnetic resonance imaging, radioimaging and other imaging methods and are also useful in the diagnosis and treatment of coronary conditions where fibrin plays a role. The fibrin binding moieties are useful for detecting and diagnosing numerous pathophysiologies in which fibrin plays a role eg. peritoneal adhesions which often occur after surgery or inflammatory and neoplastic processes and are comprised of a fibrin network, fibroblasts, macrophages and new blood vessels; rheumatoid

```
arthritis, lupus or septic arthritis which often have bits of fibrin containing tissues called rice bodies in the synovial fluid of their joints; thrombocytopenic purpura, a type of anaemia in which deposits in arterioles causes turbulent blood flow resulting in stress and destruction of red blood cells. The fibrin specific agents can also be used to detect hypoxia or ischaemia of heart, kidney, liver, lung, brain or other organs, as well as the detection of tumours, diabetic retinopathy, early or high-risk atherosclerosis and other autoimmune and inflammatory disorders. Fibrin specific agents also could provide both direct or surrogate markers of disease models in which hypoxia and angiogenesis are expected to play a role. The invention is also useful for screening molecular libraries. The present sequence is a fibrin binding peptide.

combinatorial sss one 88 Identifying receptor-binding peptides comprises screening combin peptide library presented in form of cells each of which coexpre peptide member and receptor with signal producing system for rep binding

Disclosure; Page 142; 175pp; English.

๙ receptor receptor of ducing The invention relates to identifying a binding peptide which binds a receptor and which is a member of a combinatorial library of peptides, comprising screening a combinatorial peptide library presented in the form of cells which coexpress the receptor or its ligand-binding receptorety and one member of the library, together with a signal producing system for reporting binding of the peptide to the receptor. Also included is a method for predicting the receptor-modulating activity of compound which modulates the biological activity of a receptor comprising (a) identifying peptides which bind the receptor by the method above, (b) using a number of the peptides to predict the recept modulating activity of a compound by (i) providing a panel of

antibodies and immune complexes

to the receptor depending on reference conformations the receptor is

in, where the effect of a number of reference substances known to

modulate the biological activity of the receptor on the binding of each

member of the panel is known and is characterised as a reference

fingerprint for each reference substance, (ii) screening a test substance

of unknown activity relative to the receptor to determine its effect on

the binding of each member of the panel to the receptor, thereby

obtaining a test fingerprint for the test substance, (iii) comparing the

test fingerprint to the reference fingerprints and (iv) predicting the

test fingerprints. The method is useful for identifying a binding

peptide which binds a vertebrate, mammalian, preferably human receptor,

an intracellular, nuclear, oestrogen or androgen receptor. The identified

peptides which bind to the receptor are useful for predicting the

creeptor-modulating activity of a compound (e.g. ant/agonists).

The receptor-binding library members are useful in the prediction of the

ability of small organic molecules, suitable for pharmaceutical use

(e.g. in the case of oestrogen receptors, for breast cancer treatment),

to interact with the receptor. The analyte-binding molecules can also be

used for in vivo imaging. The method has several advantages over whole

animal-based assay systems in that the same technology can be applied to

throughput sereening and compound characterisation, and gives very ö distinct patterns for agonists and antagonists of receptor activity using very much less protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP-1, or the activation of transcription by E2F-1/DP-1 heterodimers. They may also be used for inducing apoptosis and/or cell cycle arrest in a cell, particularly for treatment of cancer or other proliferative disorders such as psoriasis and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transcription factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                                                                                                                   neutrophils, monocytes and control diseases or diseases or diseases, chronic inflammation reactions. The diseases or diseases, cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                          The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders including cardiovascular diseases, disease of the central nervous system,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            formylated peptide receptor; FPR; neutrophil; monocyte; endothelial celinflammation; cardiovascular disease; central nervous system disease; gastrointestinal disease; skin disease; genitourinary disease; joint disease; respiratory disease; HIV infection; antiinflammatory; cardiant; cerebroprotective; neuroprotective; nootropic; dermatological; gynecological; immunosuppressive; anti-HIV.
                                                                                                                                                                        joint
                                                                                                                                                                                                                                                                                                            Gaps
The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5a, and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, in a serie of the central nervous system,

                                                     from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders includ cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Proteifrom Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  skin

                                                                                                                                                                                                                                                                                                                   The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the CSa-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders including cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                                                                                                                                                                                           The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47163) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                   The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases diseases, respiratory diseases and HIV infection.

                                                                                                                                                                                             The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

                                                          The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Staphylococcus aureus (CHIPS) having CHIPS activity, useful in prophylaxis and treatment of inflammation, cardiovascular, skin skidney diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Staphylococcus aureus CHIPS-related peptide #782.

The present invention describes a composition (I) comprising stress protein-peptide complexes (SPPC) associated with tumours that is specifically immunogenically cross-reactive with cell surface-associated SPPCs specific to target cancer (TC). Also described is an isolated antigen-binding fragment of an antibody that binds specifically to SPPCs or a population of different SPPCs consisting of immunogenic cancer cell surface-associated SPPC of TC. (I) has cytostatic activity and can be surface-associated SPPC of TC. (I) has cytostatic activity and can be surface-associated SPPC of TC. (I) has cytostatic activity and can be subject, such as astrocytoma, fibrosarcoma, myxosarcoma, ilposarcoma, coligodendroglioma, ependymoma, medulloblastoma, and primitive neural cetodermal tumour (PNET). (I) is useful as cancer immunogen including vaccines. (I) is useful for diagnostic and palliative use, for detecting vaccines. (I) is useful for monitor the course of amelioration of
                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunogenically cross-reactive; cancer; immunogenic cancer cell; cytostatic; vaccine; tumour-specific immunogenic response inducer; astrocytoma; fibrosarcoma; myxosarcoma; liposarcoma; oligodendroglioma; ependymoma; medulloblastoma; primitive neural ectodermal tumour.

The present invention describes a 10-50 residue peptide (I) comprising a polymeric immunoglobulin receptor (PIGR)-binding domain. (I) can have antiasthmatic, antiinflammatory, antiinfectious, cytostatic, antiulcer, antidiarrhoeal, hepatotropic, virucide, vasotropic, anti-human immunodeficiency virus and antibacterial activities. (I) can be used for targeting and transport to the mucosal epithelium, for the accessible to mucosal epithelia, including asthma, bronchitis, emphysema, cystic fibrosis, bronchiectasis, bronchiolitis, pulmonary oedema, viral tracheobronchitis, sleep apnea syndrome, infectious diseases, neoplastic conditions, Loffler's syndrome, kyphocliosis, dysphagia, peptic ulcers, diarrhoeal diseases, ulcerative colitis, Crohn's disease, hepatitis, cirrhosis, haemorrhoids, systemic vasculitis, acquired immunodeficiency syndrome, gonorrhea, syphilis and chlamydia. (I) can be attached to a detectable label for use in diagnostics. The present sequence represents a specifically claimed example of (I), derived from the human C-alpha-3

Peptides AAW38108-13 function as recognition units of the dystrophin WW domain. They were identified from a random peptide phage display library using the dystrophin WW domain as a probe. The peptides were used as probes themselves to screen a lambda-Exlox mouse 16 day embryo containing WW domains, capable of binding to these peptides are identified. The WW domain is a small functional domain found in a large number of proteins from a variety of species including humans, nematode and yeast. Its name is derived from the observation that two tryptophan residues, one in the amino terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most proteins containing the carboxyl terminal portion, are conserved. Most proteins containing ww domains have a function involving cell signalling and growth regulation or the organisation of the cytoskeleton. Polypeptides containing a WW domain are identified by treating a multivalent recognition unit complex. Proteins selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domains are used for targeted drug screening, i.e. to identifying those with selective affinity for the complex. Proteins containing WW domains in interactions. The valency of the recognition unit is important in determining specificity of interaction with WW domains. In multivalent form specificity is relaxed, but not lost, so proteins containing WW domains similar, but not identical, to the sequence of the peptides' target WW can be detected, including new polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying cell signalling and growth regulatory polypeptides breaction with multivalent recognition complex - polypeptides are useful in targetted drug selection

The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitope) derived from the cancer antigen, NY ESO-1. The MHC-II epitopes from NY ESO-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP restricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cells expressing the NY-ESO-1 gene product. The cancer peptides are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of calls expressing the NY-ESO-1 gene product. The cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral-mediated immunity against cancer. The present sequence is human HLA-DP restricted T cell epitope of NY ESO-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       93

                                                                                                                                                                                                                                                                                                                                    factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP or the activation of transcription by E2F-1/DP-1 heterodimers. The may also be used for inducing apoptosis and/or cell cycle arrest a cell, particularly for treatment of cancer or other proliferati disorders such as psoriasis and restenosis.

                                                                                                                                                                                                                                                 the
                                                                                                                                                                                                                             The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system,

The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis,
                                                                                                                                                                                                                                         disorders include
                                                                                                                                               The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47163) derived from the Chemotaxis Inhibitory Protein from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

The patent discloses the following new peptides, which are opioids which bind specifically to the mu receptor: Ac-Phe-Arg-Trp-Trp-Try-Xaa-NH2 (1); Ac-Arg-Trp-Ile-Gly-Trp-Xaa-NH2 (2); Trp-Trp-Pro-Lys-His-Xaa-NH2 (3); Trp-Trp-Pro-Xaal-NH2 (4); Tyr-Pro-Phe-Gly-Phe-Xaa-NH2 (5); Trp-Trp-Pro-Xaal-NH2 (4); Tyr-Pro-Phe-Gly-Phe-Xaal-NH2 (5); Trp-Trp-Met-D-Trp-D-Trp-Gly-Xaa2-NH2 (6); Tyr-Al-B2-C3-NH2 (214); D-Ile-D-Met-D-Thr-D-Trp-Gly-Xaa2-NH2 (7); Tyr-Al-B2-C3-NH2 (214); Trp-Trp-Pro-D4-(His)z-(Xaa)z-NH2 (222); where Xaa = any natural amino acid; Xaal = Lys or Arg; n and z = 0 or 1; Xaa2 = Gly or the D form of any naturally occurring amino acid; Al = D-norvaline or D-norleucine; B2 = Gly, Phe or Trp; C3 = Trp or naphthylalanine; x and y = 0-2, but not over 2 in total; Xaa3 = Phe, DPhe or benzylamino; D4 = Lys or Arg; Pm and red indicate permethylation and reduction of all C0 in peptide links to methylene. These new compounds are useful: (i) for in vitro

assay and study of opiate receptor subtypes, particularly mu receptors in the brain; (ii) for in vivo localisation of receptor subtypes; and (iii) therapeutically to block the peripheral effects (e.g. constipation and pruritus) of centrally acting pain killers such as morphine. They are very selective for the mu opioid receptor, over binding to the delta and kappa receptor subtypes.

The present sequence is a specific example of a peptide (2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           can pe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     block
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses eight new groups of opioid peptides which bind to the mu-receptor to act as agonists or antagonists. The peptides can be used for in-vitro assays to study opiate receptor subtypes (especially the mu type) in brain or other tissue samples; and for in-vivo diagnosis to localise opioid subtypes. The peptides are also useful as drugs to treat pathologies associated with other compounds which interact with the opioid receptor system. Therefore they can be used in medicaments for treating pathologies associated with the mu receptor and as analgesics. They can be used therapeutically to block the peripheral effects of centrally acting pain killers, e.g. to prevent side effects such as constipation and pruritis associated with morphine. The present sequence represents a specific example
                                                                                                                                                                    Gaps

The specification describes opioid peptides, in which each of the N atoms in the peptide backbone between respective amino acids is modified by permethylation, perallylation, perethylation, perbenzylation. and pernaphthylation. The peptides inhibit ligand binding to an opioid receptor. Specifically, the peptides inhibit the micro-selective opioid peptide enkephalin. The peptides can be used in vivo diagnostically to localize opioid receptor subtypes. They can be used to treat pathologies associated with other compounds which interact with the opioid receptor system. The peptides are especially useful for blocking the peripheral effects of centrally acting pain killers such as morphine. AAY23005-Y23024 represent opioid peptides of the invention, and are derived from the general sequence given in AAY23004.

The may also be used for inducing apoptosis and/or cell cycle arrest a cell, particularly for treatment of cancer or other proliferat disorders such as psoriasis and restenosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, jc diseases, respiratory diseases and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, diseases, respiratory diseases and HIV infection.

The invention includes amino acid and polynucleotide sequences for TADG5, and oligonucleotides which bind to either the basic amino acid region and/or the zinc finger motif of the TADG5 protein. The basic amino acid region or zinc finger motif of TADG5 is useful for regulating the expression of the TADG5 gene in a cell. The TADG5 protein is useful as a source of amino acids, as a nutrition supplement, and as a marker for human tissue, or in cell cycle control. TADG5 protein or peptides generated from the protein sequence are useful as antigens for the production of polyclonal and monoclonal antibodies. DNA encoding TADG5 is useful as an antisense vehicle for cell cycle control by
                                                                                                                                    The invention relates to an antigenic composition comprising an isolated primate lentivirus whose genome contains an engineered non-revertible null mutation in the nef gene, or an infectious DNA clone in a carrier. The antigenic composition is used in vaccines against infection by the

CC shutting down signalling or cell division. The present sequence
CC represents a peptide identified from a phage display peptide library
CC through biopanning with the TADG5 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the Austra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 5
A60409
bombesin-like peptide L - frog (Pseudophryne guentheri)
C;Species: Pseudophryne guentheri
C;Species: Pseudophryne guentheri
C;Date: 30-Jan-1993 #sequence_revision 30-Jan-1993 #text_change 18-Aug-2000
C;Accession: A60409
R;Simmaco, M.; Severini, C.; De Biase, D.; Barra, D.; Bossa, F.; Roberts, J.D.;
Peptides 11, 299-304, 1990
A;Title: Six novel tachykinin- and bombesin-related peptides from the skin of the A;Reference number: A60409; MUID:90287814; PMID:2356157
A;Accession: A60409
A;Molecule type: protein
A;Residues: 1-13 <SIM>
C;Superfamily: unassigned animal peptides
C;Keywords: amidated carboxyl end; hormone; neuropeptide; pyroglutamic acid
F;1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
F;13/Modified site: amidated carboxyl end (Met) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         M
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of

        FUNCTION: LABADITIN IS AN ACTIVE PEPTIDE WHICH INHIBITS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION IN VITRO. ACTIVISEEMS TO BE BASED ON AN INTERACTION WITH C1.

PTM: This is a cyclic peptide.

DISEASE: LATEX OF THIS PLANT IS USED IN FOLKLORIC MEDICINE TREATMENT OF INFECTED WOUNDS, SKINS INFECTIONS AND SCABIES.
